

KEEP TIME IN LINUX

The clock that is managed by Linux kernel is not the same as the hardware clock.

Hardware clock runs even when you shutdown your system.

Hardware clock is also called as BIOS clock. You can change the date and time of the hardware clock from the BIOS. Usually when the system starts, it takes the time from the hardware clock.

- Keep Accurate Time With NTP

ntp is network time protocol:

- start ntp service **[sudo service ntp start]** or **[sudo systemctl start ntp]**
- or start ntpd daemon **[sudo ntpd]**

- hwclock

Usually when the system starts, it takes the time from the hardware clock.

- set system clock to hardware clock: **[sudo hwclock -w]** or **[sudo hwclock --systohc]**
- set hardware clock to system clock: **[sudo hwclock -s]** or **[sudo hwclock --hctosys]**

*Check System Time And Hardware Time & Check That Both Are The Same

- run: **[date]**
- run: **[sudo hwclock]**
